Carrying capacity varies throughout the year--and from year to year--depending on conditions within the habitat such as rainfall, competition from domestic animals, and the impact of human activity. An area of bear habitat can support only a specific number of bears, just as a one gallon bucket can hold only one gallon of water.

How many bears in this activity could have survived? The number of bears an area can support is called that area's carrying capacity. The teacher will help the students calculate the carrying capacity by dividing the total number of points obtained by the group collectively by 80 (the number of pounds to keep a bear alive for 10 days). Apply the carrying capacity idea to other animals. (For example, if the carrying capacity in an area for moose is 50, what happens if there are 75 moose?)
