Vision imbalance (anisometropia) after cataract surgery

While cataract surgery can safely be performed at any stage of their development, doctors only operate on one eye at a time. This means that in between surgery, your eyes will be out of balance with each other until after the surgery with the second eye. This vision imbalance is referred to as anisometropia, which is derived from the Greek words that literally translate to “the measure of vision is not equal.”.

EyeWorld | Anisometropia decoded

When a patient only has good vision in one eye, this eye dominates and the brain suppresses the weaker eye. Therefore, any vertical imbalance present in the written prescription will not actually translate to becoming a vision problem for the patient. NOTE: Correcting for induced vertical imbalance is especially critical when it is of recent onset. For example, following cataract, or refractive surgery on one eye only.
